

Logi Composer try and buy docker based distribution.

To try latest Logi Composer, clone this repo (or download as zip file) and execute this code in your terminal

Linux:

```
cd latest
./try-logicomposer.sh up --build --detach
```

Windows:

```
cd latest
./try-logicomposer.ps1 up --build --detach
```

make sure you have docker and docker-compose installed before running this command.

Logi Composer login info

Logi Composer instance is available at <http://localhost:8080/>

Use admin/admin user/password to access data and visualizations
Use supervisor/supervisor user/password to configure the instance

Wrapper script additional

Wrapper scripts (`try-logicomposer.sh` and `try-logicomposer.ps1`) can consume regular `docker-compose` command as input. More to read [here](#).

Common actions:

- to stop all containers:

```
./try-logicomposer.sh stop
```

- to remove all stopped containers:

```
./try-logicomposer.sh rm -f
```

Windows related steps

- download and install [git](#).
- make sure to set git default behavior of new line chars handling before cloning the repository

```
git config --global core.autocrlf false
```
